AI Marketing Agency: Agency Plan

Student: Abdul Qaleeq Mohammed | Course assignment: Design & Deploy an Autonomous AI Agency | Built on markfulton/ai-employees

1. Chosen agency type

AI Marketing Agency: brand launches, ad copywriting, social campaigns and growth metrics. The demo brand is BrightBrew, a fictional ready-to-drink cold brew coffee launching in Islamabad (goal: 500 online orders in month one). Eight AI employees share one data folder. Seven do the work; the eighth, the Project Manager, audits them, logs every run to a Google Sheet and emails a daily brief. Every ad, post, reply and outreach is a draft held for human approval.

2. The 8 employees and their mapped tasks

#	Employee	Role	Mapped tasks	Output
1	marketing-chief-of-staff	Project Manager	Checks all 7 agents ran, marks silent ones MISSING, logs Timestamp | Agent Name | Task Performed | Output Status to the Sheet, emails the daily brief	Sheet rows, briefs/, email
2	market-researcher	Lead Researcher	Competitor pricing, audience reach and gaps (4 competitors)	market_brief.md
3	content-writer	Content Writer	12 ad headlines and 4 social posts in brand voice, all held	ad_copy.md, social_posts.md
4	performance-analyst	Performance Analyst	CTR, CPC, CPA and ROAS per campaign; flags ROAS under 1.5x or CTR under 1%	performance_report.json
5	campaign-builder	Campaign Builder	Two week content calendar (16 drafts) and budget split across 4 campaigns	content_calendar.csv
6	technical-auditor	Technical Auditor	Finds missing UTM links, impossible metric rows, over-limit headlines, banned claims; writes a clean metrics file	audit_report.md
7	social-triage	Support Triage	Sorts 8 inbox messages into Complaint, Sales lead, Question, Praise or Spam, ranks priority, drafts replies	triage.csv
8	outbound-strategist	Outbound Strategist	Parses lead forms, removes invalid and duplicate entries, scores and tiers target accounts	target_accounts.csv

3. Project Manager automation

Google Sheet log: scripts/runlog.mjs writes one line per run and scripts/sheet_bridge.mjs posts it to a Google Apps Script web app that appends [Timestamp | Agent Name | Task Performed | Output Status] to the Ledger tab. Failed posts are queued locally and re-sent.

Email: scripts/daily_brief.mjs builds a scannable bulletin (NEEDS ATTENTION first, then one line per agent) and the Apps Script MailApp sends it to the owner every day; a time trigger also sends it from the Sheet at about 18:30 if the laptop is off.

4. Schedule, guardrails and first results

Weekdays, Asia/Karachi: workers fire 09:00 to 16:00, the Project Manager at 18:00 so it can audit everyone. Guardrails: nothing is published, sent or spent; no credentials are stored; the logger refuses emails, links, phone numbers and secrets. First run: 8 of 8 employees reported; the Technical Auditor found 3 issues (a landing link without UTM tracking, a data row with clicks above impressions, a 34 character Google headline); the Performance Analyst flagged TikTok (ROAS 1.11x, CTR 0.6%) as the bottleneck while Email led at 20.16x ROAS.

Deliverables: GitHub repo (.installed.json, scripts, apps-script, employees), live Google Sheet ledger, daily brief emails, screen recording and project PPT.
